

Data Analysis on Drug usage By Different Age Groups

Team Members:
Princy Chaudhary(088)
Ria Saraswat(096)

INTRODUCTION

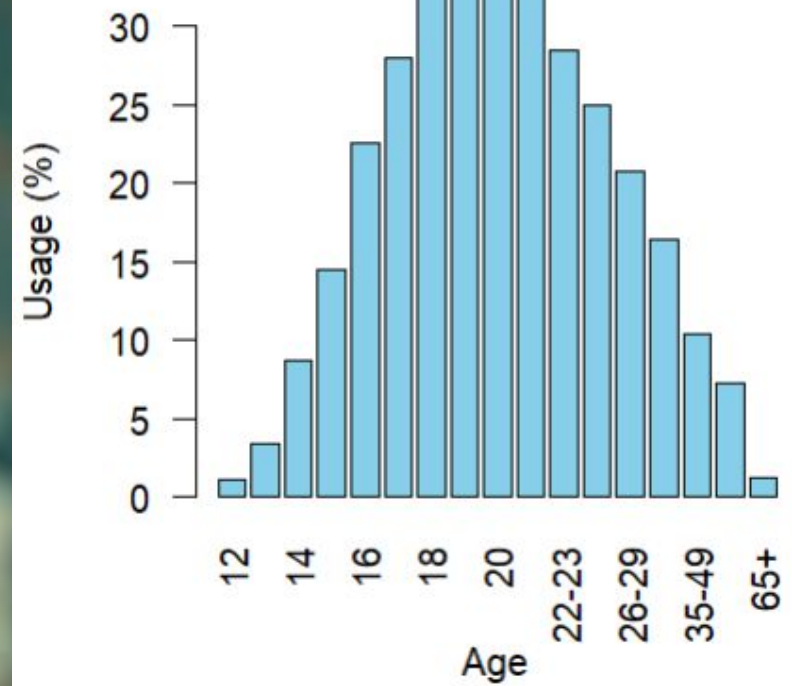

- This dataset focuses on drug usage patterns and depressant consumption across different age groups.
- It includes information on how individuals of various ages use, misuse, or rely on depressant substances, such as sedatives, anti-anxiety medications, alcohol, or prescription drugs.
- The purpose of the dataset is to identify trends, compare usage levels, and analyze how drug consumption differs between youth, adults, and older populations.
- Such analysis helps in understanding risk factors, vulnerable age groups, and the societal impact of depressant use.

The dataset can be used to support public health research, create targeted awareness programs, and assist policymakers in designing age-specific interventions.

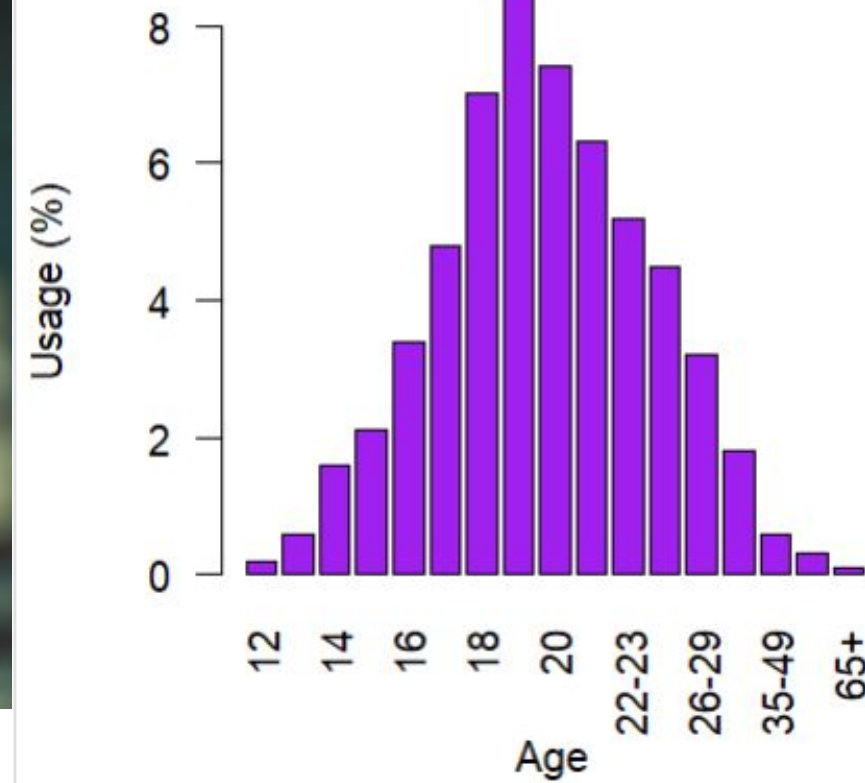

Drugs:Data Visualisation

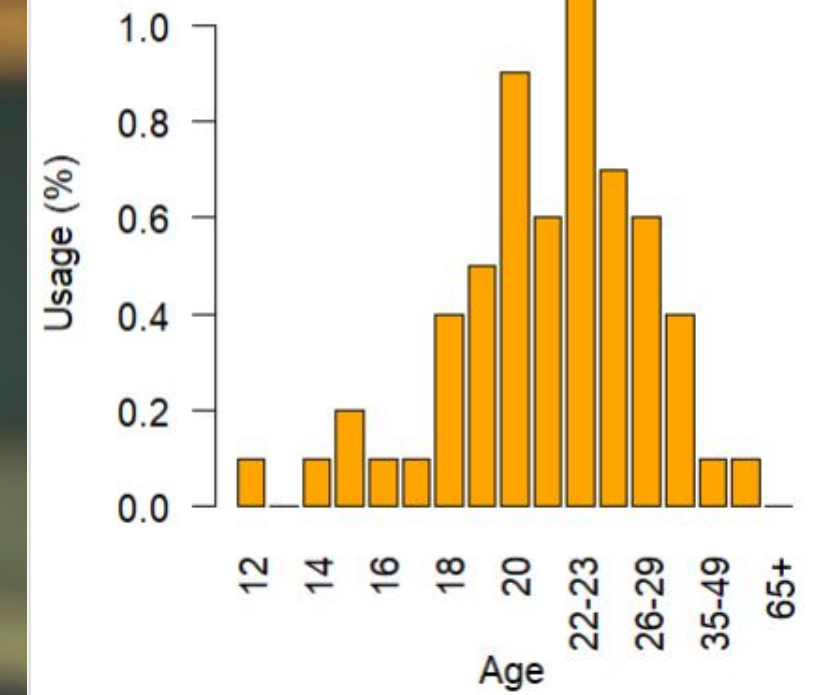

Marijuana Use by Age

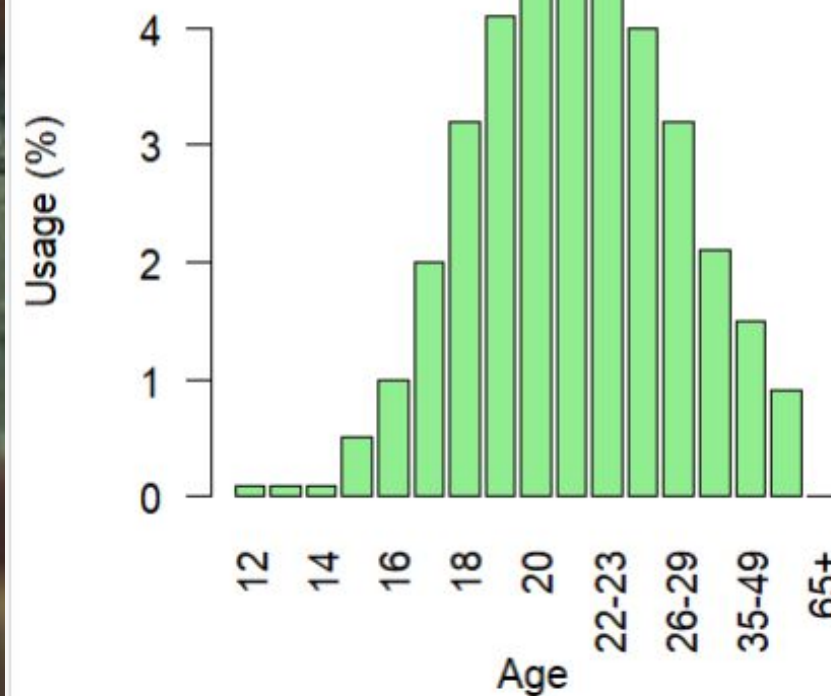

Hallucinogen Use by Age

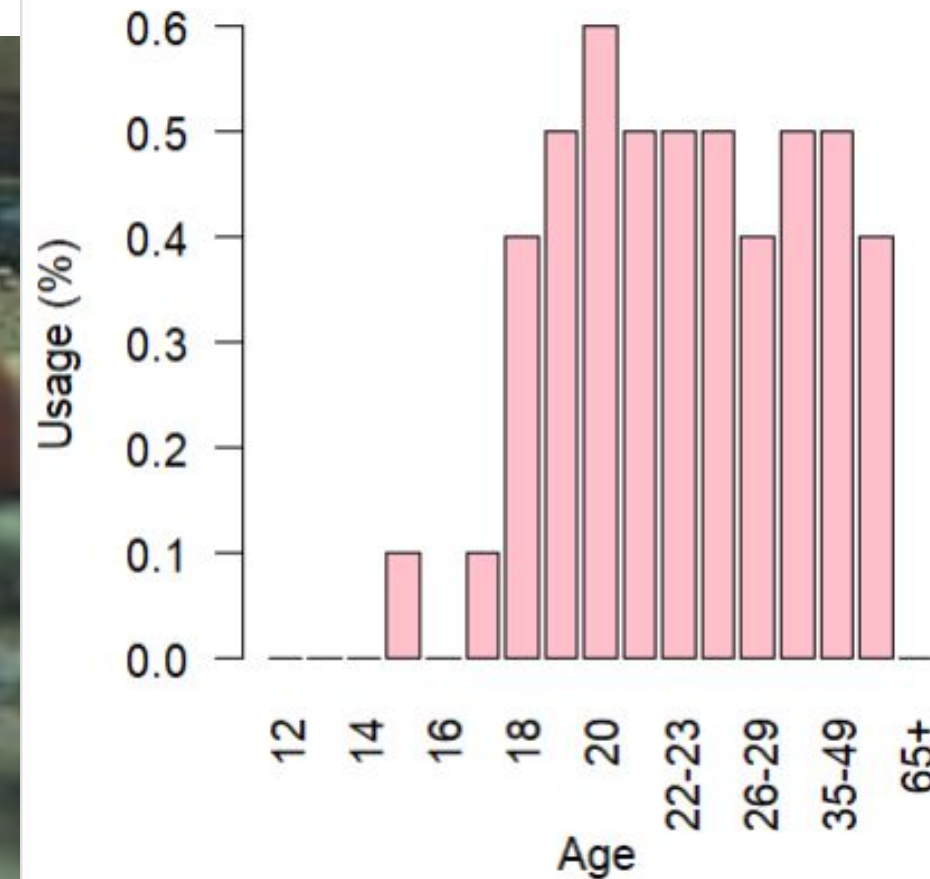

Heroin Use by Age

Cocaine Use by Age

Crack Use by Age

DRUGS: Data Interpretation

- 1). Marijuana has the highest average usage rate among the five drugs, with an average use rate of about 18.9%, peaking around age 20.
- 2). Cocaine and crack usage are much lower on average, with crack having the lowest average use ($\sim 0.3\%$), but crack use shows a strong positive correlation with age, increasing notably in middle age groups.
- 3). Heroin use is low on average ($\sim 0.35\%$) but tends to peak in the 22-23 age group.
- 4). Hallucinogen use averages around 3.4%, with the highest usage seen in the 19-year-old age group, but it shows a slight negative correlation with age, indicating usage decreases as age increases.

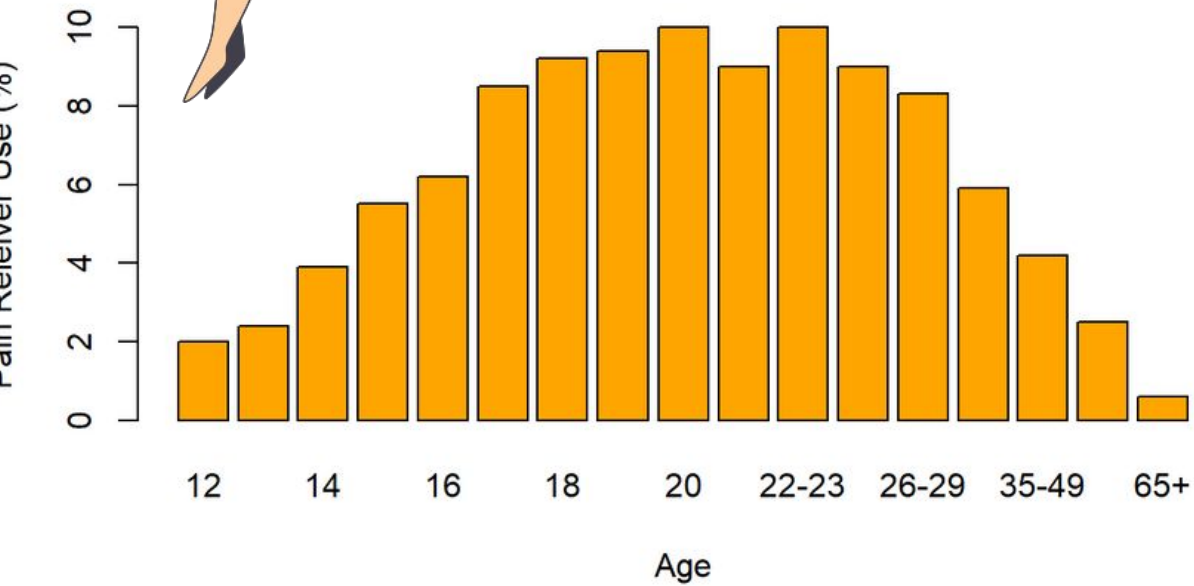

The youngest age groups (around 12-13 years) and the oldest

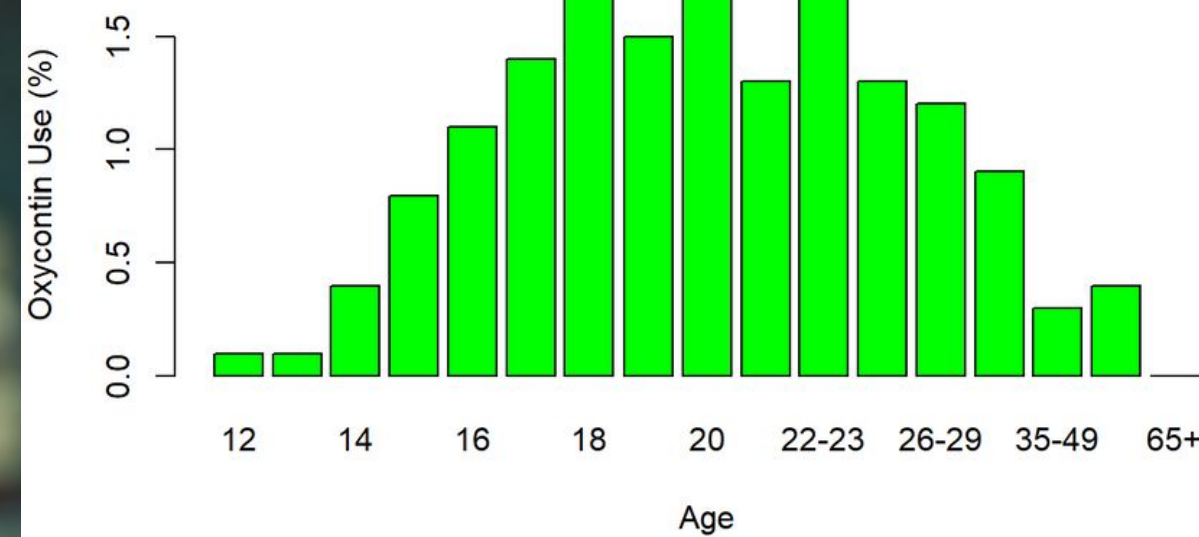

Depressants :Data Visualization

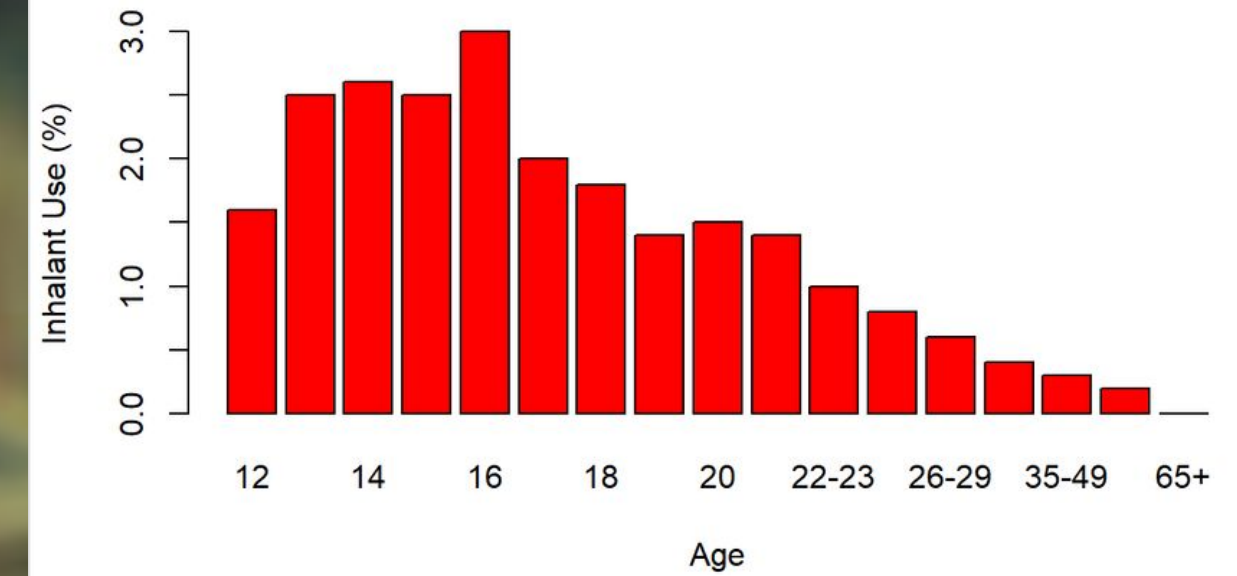

Pain Reliever Use by Age

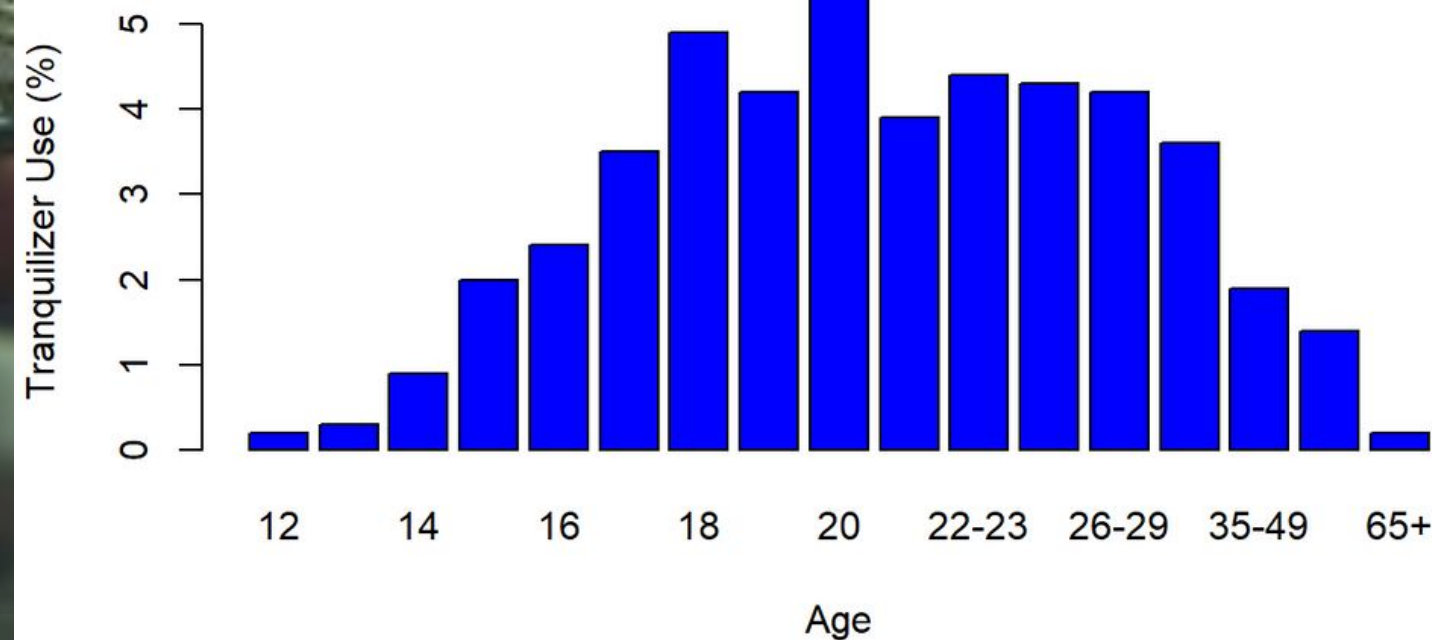

Oxycontin-use by Age

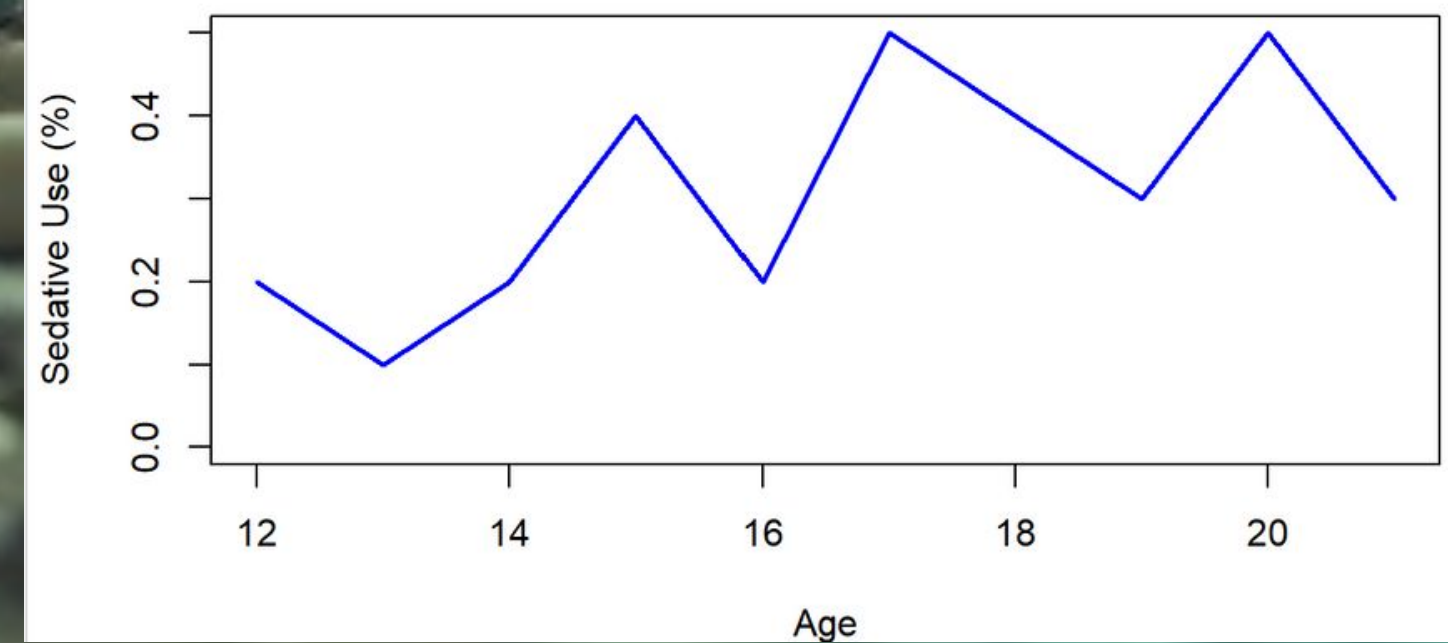

Inhalant Use by Age

Tranquilizer Use by Age

Sedative Use by Age

Depressant: Data Interpretation

1. Inhalant use is relatively low overall (average $\sim 1.39\%$) and peaks in early to mid-teens (ages 14-16) before steadily declining to near zero in older age groups.
2. Pain reliever use is the highest among these substances (average $\sim 6.27\%$), with a gradual increase from early teens, peaking in the early 20s, and then slowly declining with age.
3. Oxycontin use remains low (average $\sim 0.94\%$) but shows a slight increase in young adults (ages 18-34) before tapering off in older age groups.
4. Tranquilizer use has a moderate average rate ($\sim 2.81\%$) and increases steadily from early teens, peaking in the early 20s to mid-20s, then gradually decreases with age.
5. Sedative use is the lowest among these substances (average $\sim 0.28\%$) and remains relatively stable across age groups, with a slight peak in late teens and early 20s.

Bibliography

Our dataset covers a part of survey. It contains data of 4 commercial drugs and 5 drug depressant usage across 17 age groups in past 12 months starting from 2015.

Glimpse

Drugs:(Princy)

1. Alcohol
2. Marijuana
3. Cocaine
4. Heroin

Depressants:(Ria)

1. Inhalant
2. Pain Reliever
3. Oxycontin
4. Tranquilizer
5. Sedative

The image features a scenic mountain landscape with a central purple diamond containing the text "THANK YOU". The background is a composite of several mountain scenes, including a dirt road on a hillside, a valley with a river, and distant mountain ranges under a cloudy sky. The central diamond is a vibrant purple-to-pink gradient, and the text is in a bold, white, sans-serif font. The overall design is modern and artistic, with a focus on nature and gratitude.

**THANK
YOU**
